EXHIBIT 5

Claim Chart for Claim 1 of the 7,075,673 Patent

<p>A system configurable to input information from an electronic document template displayed on a display of a first computer into a plurality of application programs operable on another computer in which said template automatically generates content instructions to extract data and to transmit said data to at least one field in at least one of said plurality of application programs according to customizable transmission format instructions which are dependent upon and compatible with said at least one application program, operating on said other computer, that is receiving said transmitted data.</p>	<p>The http://www.walgreens.com/ website ("Website") includes technology for displaying in a browser a web page that contains fields for receiving information input therein. For example, the Website uploads to the browser HTML code that causes the browser to display on a customer's computer the HTML document found at https://www.walgreens.com/checkout/express/eo_shippinginfo.jsp?event=start_checkout that contains a form into which a customer seeking to purchase products from Walgreen can enter information, i.e., shipping information including customer first and last name and address, that will be transmitted to an application program running on a web server associated with the Website.</p> <p>To process the entered information, the browser interprets code contained in the HTML form to automatically generate computer-executable instructions (content instructions) that identify and extract the information entered into the HTML document that is required by the application program running on the web server. The system also defines the format and protocol, i.e., POST and https for the aforementioned web page, used to transmit the extracted information required by the particular application program (customizable transmission format instructions).</p>
